

For male erectile dysfunction

MED™

The maker of Vitalee MED™ have addressed most of the symptoms of male erectile dysfunction and it has been formulated with a proprietary natural blend of Epimedium grandiflorum extract, D-Phenylalanine, Inositol hexanicotinate, Yohimbine, Panax ginseng extract, Polypodium Extract, Phosphatyl serin, Tribulus terrestris, HGW, Lepidium Meyenil, Sho Wu, Phenyl ethylamine, Serotonin, Dimethylaminoethanol bitartrate, and Damiana as an aphrodisiac. Modern research studies about these natural hormones have shown to increase sperm count in males and the strength of eggs in females. It has also been shown to help erectile dysfunction, anorgasmia. increase blood flow and stimulation in sexual organs.

Scientists exposed the existence of pheromones in humans in 1986 and have been studying them ever since. They have revealed that pheromones act as Aphrodisiac. The word pheromone is derived from the Greek words "Pherein" and "hormone" which together mean "excitement carrier" in English. It has been confirmed that animals possess individual scent "prints" that are found in sweat and urine which attract the opposite sex and dictate certain sexual behaviors. Pheromones have been demonstrated to bring about an increase in luteinizing hormone (LH) in women, thereby causing a woman to have a heightened sexual responsiveness to a man. They are also believed to release neurotransmitters that directly modify women's behavior, such as triggering sexual excitement.

An efferscent drink for ED patients

Many things can cause impotence, including having atherosclerosis (hardening of the arteries), high blood pressure, diabetes, depression and other emotional or psychological illnesses, pelvic surgery, kidney failure, multiple sclerosis, stroke, some types of epilepsy, and alcoholism. Some men who take medicines for heart disease or drugs that can affect the central nervous system, such as hormonal medicines or heroin and cocaine also are at risk for impotence.

Business stress, economical ups & down, caring for a sick family member and many other stressors can decrease libido. Loss of libido (reduced or lost interest in sex) also can occur at different points in a man's life. It can happen for many reasons, including stress in our daily lives, from illnesses, medications, psychiatric problems, and reduced levels of male sex hormones. Also, uneven sexual desire, at times, between you and your partner are normal and inevitable in long-term relationships. It is how you handle these challenges that make the difference. Seemingly little things that taste good, smell good, or delight the senses can be very significant in intimacy when systematically included in your daily routine.

Both estrogen and testosterone are hormones that can be found in both men and women. The difference is between the amount found in males and a female is extremely different. Males produce as much as 6-8 mg of testosterone per day versus women who only produce about 0.5 mg per day. Estrogen is important for women due to its ability to help maintain the vaginal lining, produce lubrication, and maintain breast shape. In men, estrogen has no known purpose. However, too much estrogen in men can be a cause of reduced sexual need, erectile dysfunction, cause difficulty in building muscle, and make it difficult to lose fat. Testosterone in men is essential for a healthy sexual appetite. Many men who have testosterone deficiencies show a decrease in sexual desire, erectile dysfunction, and low-self esteem.

There is a belief that the production of estrogen in men can also cause a decrease in the production of testosterone. Resveratrol is added to act as an anti-estrogen to help suppress the creation of excessive estrogen. There could be many benefits to our sexual health by having less estrogen in our bodies. The battle between estrogen and testosterone could lead to the advantage of more efficient uses of testosterone throughout our bodies. More testosterone and less estrogen means increased sex drive, the ability to build muscle mass and lose fat, and a more positive state of mind. Dose Size: 187 ml/day. Shake well. NO Dilution Required
